PROJECT REPORT · OCTOBER 2026

We updated the Coordination Manager skills

For three weeks we checked every "skill" (the instruction guides an AI assistant reads before working on a part of the app) against the real code, tested how much each one helps, and retrained only where it mattered.

The app finds meeting times where everyone's availability overlaps. This report does the same for skills: where the guide and the code agree.

30 → 23 skills after cleanup	**~286** wrong or outdated statements corrected	**~87** human judgment calls made
79% → 94% average task score, without vs with skill	**3 weeks** paced by weekly usage limits	**30M+** tokens spent (estimate)

HOW IT WORKED

Four steps, applied to every skill

A skill only helps if what it says is true today. So each one went through the same pipeline, and training happened only where testing showed room to improve.

STEP 1

Fact-check

Every concrete claim (file names, rules, numbers) checked against the code, with evidence for each fix.

STEP 2

Write test tasks

4 to 6 realistic tasks per skill, drawn from recent real work on that part of the app.

STEP 3

Score blind

Claude did each task once without the skill and once with it. A separate grader scored results without knowing which was which.

STEP 4

Train if needed

Only skills with a clear gap got rewritten and re-tested. The rest stopped once they were accurate.

OUTCOMES

What happened to each skill

Most skills only needed their facts corrected. Three showed a real gap and were trained. Seven were cut or folded into others.

17

Fact-check was enough

Once corrected, these scored high. Extra training would add cost without a measurable gain.

`express-api`
`testing-strategy`
`coordination-calendar`
`+14 more`

3

Trained

Tests showed real headroom, so these were rewritten and re-scored blind.

`mailbox-feature`
`design-system`
`ai-feedback-loop`

3

Merged or replaced

Overlapping guides combined into one, so the assistant has a single clear source.

`mobile-ux (2 into 1)`
`prompt-enhancement-agent`
`updating-skills`

5

Stopped using

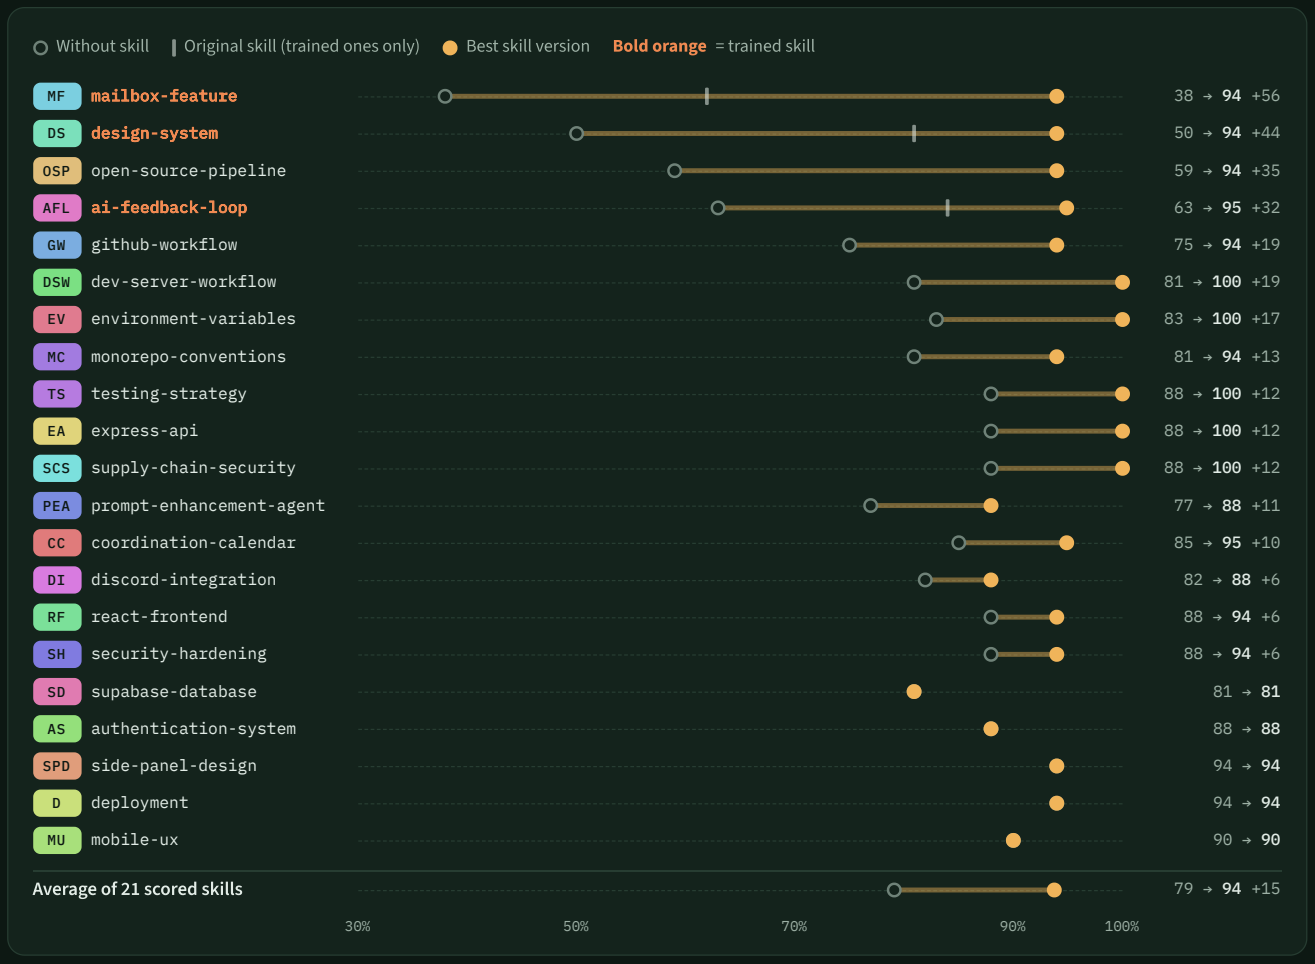

Covered features no longer in the app, or work that was better done elsewhere.

`miro-integration`
`gamechanger-scripting`
`gamechanger-environment`
`cardano-fee-modeling`
`vercel-deploy`

EVALUATION SCORES

How much each skill helps

Each line shows the blind grader's score for Claude working without the skill (open circle) and with the best version of the skill (gold dot). A longer line means the skill adds more. For trained skills, the small tick marks the score before training.

Scores are the share of checks passed on 4 to 6 tasks (calendar used 6; most used 4, one run each). With so few runs, differences under about 10 points are within normal variation. Two skills were not scored: run-coordination-manager needs live servers, and updating-skills edits the skill library itself.

PER SKILL

Corrections and judgment calls

"Corrections" counts statements in the skill that were wrong or out of date. "Judgments" counts decisions that needed a person: is this behavior intended, should the app change, or should the guide change. Judgment counts are approximate, tallied from the decision log.

Checking guides against code kept surfacing places where the app, its docs and the guides disagreed. Each one needed someone to say which was right.

Is this a bug or intended? | Fix the app | Product direction | Scope judgments

TICKER	SKILL	CORRECTIONS	JUDGMENTS	WITHOUT	BEST	OUTCOME
MF	**mailbox-feature** Gmail and Outlook sync, mail automation	11	10	38%	94%	Trained
DS	**design-system** Colors, buttons, dialogs, motion	25	15	50%	94%	Trained
OSP	**open-source-pipeline** Publishing the public version	6	4	59%	94%	Fact-check enough
AFL	**ai-feedback-loop** Improving AI answers from user feedback	9	2	63%	95%	Trained
GW	**github-workflow** Branches, pull requests, CI checks	10	2	75%	94%	Fact-check enough
DSW	**dev-server-workflow** Starting and stopping local services	10	2	81%	100%	Fact-check enough
EV	**environment-variables** Configuration and secrets placement	19	1	83%	100%	Fact-check enough
MC	**monorepo-conventions** Packages and shared scripts	11	1	81%	94%	Fact-check enough
TS	**testing-strategy** Writing and running tests	13	2	88%	100%	Fact-check enough
EA	**express-api** Server endpoints and their safety checks	11	5	88%	100%	Fact-check enough
SCS	**supply-chain-security** Dependency safety	9	2	88%	100%	Fact-check enough
PEA	**prompt-enhancement-agent** Turning vague requests into plans	7	2	77%	88%	Merged
CC	**coordination-calendar** Calendars, availability, repeating meetings	13	9	85%	95%	Fact-check enough
DI	**discord-integration** Discord bot and moderation	15	4	82%	88%	Fact-check enough
RF	**react-frontend** How web pages and components are coded	13	2	88%	94%	Fact-check enough
SH	**security-hardening** Platform security reviews	27	6	88%	94%	Fact-check enough
SD	**supabase-database** Database tables and access rules	16	2	81%	81%	Fact-check enough
AS	**authentication-system** Google, wallet and guest sign-in	16	8	88%	88%	Fact-check enough
SPD	**side-panel-design** Sliding helper panels	20	3	94%	94%	Fact-check enough
D	**deployment** Publishing to Vercel and Railway	14	3	94%	94%	Fact-check enough
MU	**mobile-ux** Phone and touch layouts	9	1	90%	90%	Merged
RCM	**run-coordination-manager** One-command local start	1	0	-	-	Not scored
US	**updating-skills** Filing new guidance in the right skill	1	1	-	-	Merged
	Total	**286**	**~87**	79%	94%	

REFLECTION

What I took away

> The process resurfaced a lot of edge cases and conflicts, where features and behavior had drifted apart across the app. Providing judgment and changing how the app works felt productive.

Most of the value came from the questions the process forced, not from the training itself: three skills needed training, but nearly every skill exposed something about the app worth deciding.

THANK YOU

Made possible by Rotislav and Ristik

Rotislav from Ristik provided the Claude Desktop seat that ran this experiment. Three weeks of agents, graders and fact-checks is not cheap, and this work would not have happened without that support.
